                                                                                                                                                                                                                                                                                                                                                   Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                    Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              An individual can be diagnosed as having a predisposition to cancer by detecting an alteration in the wild type multiple tumour suppressor (MTS) gene, using gene probes which hybridise to the MTS1 gene ORF ART00736 (which encodes AAR81701) mutant sequences AAT00749/50. The above assay can also be used in the diagnosis and prognosis of melanoma, lymphoma, leukaemia and pancreas, breast and thyroid
                                                                                                                                                                                                                                                                                                                                                                                                                                               28-SEP-1995

Germ-line mutations of MTS cDNAs can be used for diagnosing predisposition to melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's testis, kidney, stomach and rectum. The wild-type gene is useful for gene therapy and MTS polypeptides may also be used for protein replacement therapy. Also the polypeptides or cells contg. an altered MTS gene are useful for screening for potential cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC in some B-cell lymphomas and leukaemias. D-type cyclin, cyclin CC dependant kinase (CDK), PCNA (proliferating cell nuclear antigen) and CC p21 (a 21 kDa polypeptide) exist in a quaternary complex that many CC combinatorial variations of the components e.g. cyclin D1 or D3 and CC CDK2, CDK4 and CDK5, assemble in vivo. Each quaternary complex may CC chave a subtly diferent role in the cell cycle or in different cell CC types. Cellular transformation by DNA tumour viruses such as SV40 CC is associated with selective subunit rearrangement of the cyclin D CC complexes. In virally transformed cells, CDK4 totally dissociates CC from cyclin, PCNA and p21 and becomes associated with a 16 kilodalton CC inhibits CDK4. p161NK4 was discovered to show many similarities to p16. Reagents, such as monoclonal antibodies, can be developed that recognise the interactions between the CDK's cyclins, PCNA and low molecular weight polypeptides and can therefore be used to identify CK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a transgenic mouse having germline and sommatic cells which comprise an incorporated transgene that disrupts and inhibits the p16-INK4-a gene leading to tumour susceptibility. Also described is a method of making a mouse and mouse embryonic stem cells a functionally disrupted p16-INK4-a gene which comprises transferring a transgene construct into embryonic stem cells of a mouse and transferring these into a mouse blastocyst and implanting the resulting chimeric blastocyst into a female mouse selecting offspring having an endogenous p16-INK4-a gene allele. The transgenic mouse is useful for evaluating the carcinogenic potential or the anti-proliferative activity of a test compound. The present sequence represents the human INK4 protein p16 given in the present invention.
                                                                                                                                                                                                                                                                                        Cell cycle regulatory protein; CCR; p16; diagnostic assay; detection; cell proliferation; differentiation; neoplasia; cancer; cell growth; cyclin-dependent kinase inhibitor; CDK; human; chromosome 9p21-22.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC pl6 amino acid sequence. The pl6 gene is located on chromosome 9p11-22.

CT he invention relates to a diagnostic assay which comprises detecting a cc mutation in the pl6 gene, which is used to identify a cell or cells at crisk of developing a disorder characterised by unwanted cell or cells at cc proliferation or differentiation. Pl6 is a cyclin-dependent kinase cc (CDK)-inhibitory protein, and functions as an inhibitor of cell-cycle progression and ultimately cell growth. The assay can be used for cell or cells at risk for a disorder (neoplasia) cc diaracterized by unwanted cell proliferation or differentiation. The cc method is used for detecting mutations in either a CCR gene or CDK gene cc which alter complex formation between these two proteins. The method is used for detecting mutations in other cellular proteins which cd is used for detecting mutations in other cellular proteins which cl calso used for detecting mutations in other cellular proteins which disrupt binding of complex formation between these two proteins which complex for detecting mutations in other cellular proteins which disrupt binding of complex of signal transduction proteins such as mass protein or other cellular proteins which interact with ras, e.g. will stumour complex formation in the proteins which are unable to physically interact with a convenient for detecting mutants of CCR genes encoding proteins which are unable to physically interact with a convenient for detecting mutants of CCR what convenient for detecting mutants of CCR what convenient for detecting mutants of CCR genes encoding proteins which are unable to physically interact with a convenient for detecting mutants of CCR genes encoding proteins which are unable to physically interact with a convenient for detecting mutants of CCR what convenient for detecting mutants of CCR what convenient for detecting mutants of CCR genes encoding proteins which are unable to physically interact with a convenient for detecting mutants of CCR genes encoding the detecting mutants 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

                                                                                                                                                                                                                                                                                                                                                                                Ş
                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             degeneration of tissue, e.g. Alzheimer's, Parkinson's or Huntington's diseases, gastric ulcers and autonomous diseases of the peripheral nervous system. Other applications include reducing growth of hair and protecting hair follicle cells against cytotoxic treatments, cosmetically to treat various forms of folliculitis, and to inhibit spermatogenesis or ogenesis. The chimeric proteins can also be used in vitro to maintain cells, especially neurons intended for testing specific activity of trophic factors, at selected points in the cell cycle. The proteins are more active inhibitors of the CDX/cyclin complex than binding motifs used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          derived from a fusion of the human p27 and p16 cDNA sequences. The chimeric polypeptides of the invention have cyclin-dependent kinase (CI binding motifs from at least two different proteins that bind to CDKs. The protein controls proliferation and/or differentiation of cells, particularly they inhibit cell-cycle progression. They can be used to treat a wide range of proliferative disorders, e.g. cancer, leukaemia, psoriasis, atherosclerosis, restenosis, chronic inflammation etc. They can also treat diseases associated with de-differentiation or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Chimeric inhibitor of

C(CDKS), particularly CDK/cyclin complexes. It provides a recombinant CC transfection system (A) that comprises: (1) first gene construct CC comprising a sequence encoding an inhibitory polypeptide containing at CC least one CDK. binding motif for binding and inhibiting activity of a CDK.

CC linked to a transcription regulator functional in eukaryotic cells; (1) CC second gene construct comprising a sequence encoding a polypeptide that CC promotes encoding a fusion protein, and (ii) a gene delivery composition for CC delivering the GCs to a cell for transfection. Also provided are nucleic CC polypeptide sequence (TP) from an intracellular protein that alters a cellular process when FP enters the cell, and (ii) a transcellular CC polypeptide sequence (TCP) that promotes transcytosis of FP. The FP CC consists of at least one CDK-binding motif and a TCP. (A) are used to CC treat vascular wounds that involve a break in the endothelium and CC excessive proliferation of smooth muscle, particularly restenosis but CC more generally any repair of cardiovascular damage, arteriosclerotic Lesions or for endothelialisation of synthetic vascular grafts. More CC wide range of situations, e.g. for treating vascular diseases as above; tumours (gliomas, leukaemias); chronic inflammation; neurodegeneration; cc acne; also to control hair growth (e.g. to prevent hair loss caused by chemotherapy or radiation); periodontal disease; to treat tachycardia; ct oinhibit spermatogenesis etc. Chimaeric proteins bind to CDKs so inhibit cell CC cycle progression articularly smooth muscle cell nordiferation made a cell profiferation made cell profiferation articularly smooth muscle cell nordiferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cyclin-dependent kinase; CDK; CDK/cyclin complex; inhibitory; restenosis; CDK-binding motif; endothelialisation; fusion protein; therapeutic; acne; intracellular; transcyclosis; vascular wound; repair; hair; smooth muscle; cardiovascular; arteriosclerotic; fibrotic disorder; cellular proliferation; rheumatoid arthritis; diabetes; cirrhosis; graft; tumour; inflammation; neurodegeneration; periodontal; spermatogenesis;

                                                                                                                                                                                                                                                                                                                                                                                                                                   (CELL-)
                                                                                                                                                                     The invention relates to a protein composition comprising a novel purified chimeric cyclin dependent kinase inhibitor (CDKi) and a purified adenovirus E4 protein. The compositions comprising the protein, or the DNA encoding it are useful for treating neoplasias in animals. The compositions also find use in assays to eliminate a specific sub-population of cultured cells, to determine the susceptibility of neoplastic cells to treatment with the compositions and also in assays synchronise cell growth in cultured cells.
                                                                                                                                                                                                                                                                                                                         Protein and nucleic acid compositions for preventing and treating neoplasias (particularly cancer), comprises a novel chimeric cyclin dependent kinase inhibitor and adenovirus E4 protein -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                08-SEP-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WO200052184-A1

```

replication-deficient recombinant adenovirus that lacks functional E1 and E4 regions, and comprises a transgene encoding a cyclin dependent kinase inhibitor (CDKi). The CDKi is selected from an INK4 family protein such as human p16, a CIP/KIP family protein such as p27, active fragments of these, or fusion proteins comprising (active fragments of) an INK4 family protein and a CIP/KIP family protein see Aay96046 and AAY96049). The method is to inhibit mammalian smooth muscle cell hyperproliferation, induced

The fusion protein is encoded by a nucleic acid (see CC AAX96067). The fusion protein is encoded by a nucleic acid (see CC AAX96523) that was obtained by PCR amplification of human p27 and p16 CC DNAs using primers that also included codons encoding the tag/hinge CC angiogenesis involves transducing an epithelial cell with a CC transgene encoding a cell dependent kinase inhibitor (CDK1). The CC transgene encoding a cell dependent kinase inhibitor (CDK1). The CC transgene encoding a protein of the CIP/KIP family such as p27, a CC protein of the INK4 family such as p16, active fragments of these proteins, or a fusion of 2 CDK1 proteins such as p27 and p16. The CC method is useful in treating conditions associated with angiogenesis, CC such as neoplasia, rheumatoid arthritis, endometriosis, psoriasis and vascular retinopathy (claimed). Alternatively, the transgene CC is delivered to an auxiliary cell, and is expressed by that cell current that the CDK1 is released into the blood and contacts the CC CCK4/CyclinD, CDK2/cyclinA and CDK2/cyclinE and inhibit cell cycle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents the tumour suppressor p16. The DNA encoding CC this sequence is joined to a promoter functional in eukaryotic cells and cused in the expression construct of the invention. p16 is an inhibitory CC subunit, which is involved in the control of cyclin-dependent kinase 4 cC activity, and functions as a tumour suppressor. By detecting this CC sequence or the DNA encoding it, cancer cells can be detected. When the construct can be used to restore p16 function in a cell, particularly by reversing the transformed phenotype in tumours, especially lung or bladder cancer or melanoma. It may also have anti-angiogenic activity, and inhibit hyperproliferative disorders, e.g. restenosis. When the CC expression construct inhibits p16 function. Reduced or increased levels CC of p16, or a related nucleic acid, may be diagnostic of tumours, e.g. by Southern or Northern blot, antibody immunoblot, fluorescent cell sorting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (MTS-1) protein, used in the method of the invention. The MTS gene is useful in the diagnosis and prognosis of human cancer, e.g. by standard nucleic hybridisation techniques, of patient samples. The mutated sequences are those that are present in somatic mutations of the gene in cancers. The vectors can be used for gene therapy strategies to replace function of mutated protein in patients. These can also be used to construct protein mimetics, also for therapeutic strategies. In addition the expression constructs can also be used for recombinant production of MTS. Recombinant MTS can be used to creen for drugs to be used for cancer therapy, and the protein litself may also be used to restore MTS function in a cell.
                                                                                                                                                                            18-MAR-1994;

The MTS gene locus is also referred to as the familial melanoma (MLM) gene locus, located on human chromosome 9p21. Germ line mutations in MTS genes can be used in the diagnosis of predisposition to cancers, e.g. melanoma, leukaemia, astrocytoma, gliboblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL, and cancers of the pancreas, breast, thyroid,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA specific for Multiple Tumour Suppressor useful for the diagnosis of cancers related mutation(s) and their treatment

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DB

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score
